

2015 F=ma Exam: Problem 18

Kevin S. Huang

We can't determine anything quantitative from the curves so we use the linear graph. Since $\log y$ is linear in x , we have

$$\begin{aligned}\log y &= a_1 x + a_2 \\ y &= e^{a_1 x + a_2} = e^{a_2} e^{a_1 x} = a e^{bx}\end{aligned}$$

letting $a = e^{a_2}$ and $b = a_1$. Thus, the answer is D.
