

2008 F=ma Exam: Problem 3

Kevin S. Huang

The instantaneous velocity on a position-time graph is given by the slope at that point. We have

$$v = \frac{\Delta x}{\Delta t} = \frac{(-2 \text{ m}) - (4 \text{ m})}{(3 \text{ s}) - (0 \text{ s})} = -2 \text{ m/s}$$

so the answer is A.
